RESEARCH INTERESTS

Machine Learning Systems, Hardware–Software Co-Design, Energy-Efficient AI

My research focuses on agent–hardware co-design: jointly optimizing agentic algorithms for planning and memory with accelerator architectures and execution mechanisms such as plan reuse. I extend this full-stack approach to embodied AI and robotics, where on-device vision–language–action (VLA) models require real-time, energy-efficient inference. My long-term goal is to develop reusable system abstractions and open benchmarks that bridge ML algorithms and accelerator architecture, enabling scalable deployment of agentic and embodied AI.
